## 1.1 The all-in-one solution

The **OPTISWIRL 4070 C** is the first vortex flowmeter to feature integrated pressure and temperature compensation in 2-wire technology. The **OPTISWIRL 4070 C** provides reliable measurement of operating, standard volumetric and mass flow of conductive and non-conductive liquids, gases and vapours, even with fluctuating pressures and temperatures.

- ① Pressure sensor
- ② Shut-off valve
- ③ Fully welded stainless steel design
- ④ Converter with Intelligent Signal Processing [ISP]

**Highlights**

- 2-wire device with integrated pressure and temperature compensation
- Non-wearing, fully welded stainless steel construction with high corrosion, pressure and temperature resistance
- Optimal process reliability thanks to Intelligent Signal Processing (ISP) - stable readings, free of external perturbations
- Ready to use immediately thanks to plug & play
- Maintenance-free measuring sensor design
- PACTware available at no extra cost
- Pressure and temperature available via HART

**Industries**

- Chemicals
- Oil & Gas
- Power plants
- Food & Beverage
- Pharmaceuticals
- Iron, Steel and Metals
- Paper and pulp
- Water
- Automobile industry

**Applications**

- Vapour and saturated steam measurement
- Steam boiler monitoring
- Monitoring of compressor output
- Measurement of consumption in compressed air systems
- Measurement of consumption of industrial gases
- SIP and CIP processes in the food, beverage and pharmaceutical industries
- Measurement of conductive and non-conductive liquids

## 1.2 Options and variants

### 1. The universal device with temperature compensation for saturated steam integrated as standard

The **OPTISWIRL 4070** as a compact flowmeter in a flange version is suitable for universal use in measuring liquids, gases and vapours.

The temperature compensation for saturated steam is integrated as standard, thus enabling direct compensation of the density; the mass and energy can also be measured.

Here ISP (Intelligent Signal Processing) provides stable measurement results free of external perturbations.

### 2. The easy to install sandwich version with optimised centring rings

The **OPTISWIRL 4070** as a compact flowmeter in a sandwich version is suitable for universal use in the measurement of liquids, gases and vapours. The temperature compensation for saturated steam is integrated as standard.

The flowmeter is provided with additional optimised centring rings. The OPTISWIRL can be aligned centrally by turning the centring rings, eliminating any offset between the OPTISWIRL and the pipeline.

### 3. The only 2-wire device with integrated pressure and temperature compensation

The **OPTISWIRL 4070** as a flange or sandwich flowmeter is optionally available with integrated pressure and temperature compensation for gases, wet gases, gas mixtures or vapours. The advantages of this unique design couldn't be clearer:

- No additional cost-intensive installation of pressure and temperature sensors
- No additional cabling work
- No faulty measurement results, because pressure, temperature and volume flow can be read at a single point
- Direct measurement of mass and/or energy

### 4. The highest process availability thanks to optional shut-off valve

As an option, the **OPTISWIRL 4070** can be supplied with a shut-off valve to allow the pressure sensor to be exchanged without interrupting the process.

What is more, the pressure sensor can be shut off for the purpose of pressure or leak testing of the pipeline. Using the built-in two-way valve, the pressure sensor can also be calibrated and tested at a later time.

## 5. Dual measurement for twofold reliability

The **OPTISWIRL 4070** is optionally available as a dual version.

This is a genuine redundant system with two independent measuring sensors and two signal converters. This provides twofold functional reliability and availability of the measurement.

This variant is ideally suited for measurements in multi-product pipelines. In such pipelines, two different products are moved through one after the other.

One signal converter can be programmed for one product, and the other signal converter for the other product.

## 6. OPTISWIRL 4070 F – Field housing (remote version)

The **OPTISWIRL 4070** is also available as a remote version with a field housing converter.

This feature allows separating the signal converter from the measuring sensor up to a distance of 15 m / 49 ft in case the measuring sensor is mounted in inaccessible areas. The remote mounted signal converter allows easy operation and reading of values at eye level.

Additionally to the flow rates, measurements of the integrated pressure and temperature sensors can be displayed.

### 1.3 Functional principle

Vortex flowmeters are used to measure the volumetric flow of gases, vapours and liquids at completely filled pipes.

The measuring principle is based on the Karman vortex street. The measuring tube contains a bluff body, behind which vortex shedding occurs. The frequency  $f$  of the vortex shedding is proportional to the flow rate  $v$ . The nondimensional Strouhal number  $S$  describes the relationship between vortex frequency  $f$ , width  $b$  of bluff body and the mean flow velocity  $v$ :

$$f = \frac{S \cdot v}{b}$$

The vortex frequency is recorded at the sensor and evaluated at the converter.

Figure 1-1: Functional principle

## 2.1 Technical data

- *The following data is provided for general applications. If you require data that is more relevant to your specific application, please contact us or your local representative.*
- *Additional information (certificates, special tools, software,...) and complete product documentation can be downloaded free of charge from the website (Download Center).*

### Measuring system

Application range	Flow measurement of liquids, gases and vapours
Operating method / measuring principle	Karman vortex street

### Measured value

Primary measured value	Number of separated vortices
Secondary measured value	Operating and standard volumetric flow, mass flow

### Signal converter

Versions	Compact
	Remote version - cable length $\leq 15\text{m}$ (49 ft)
	Option: Ex version

### Measuring sensor

Standard	Basic device in flange version (with integrated temperature measurement)
	Basic device in sandwich version (with integrated temperature measurement)
Optional	Basic device with additional pressure measurement
	Basic device with additional pressure measurement and shut-off valve for pressure sensor
	Dual measuring device in both flange and sandwich version (redundant measurement)
	Dual measuring device in flange version with additional pressure measurement

### Display and user interface

Local display	2 lines, 10 characters per line
Operating and display languages	German, English, French

### Measuring accuracy

Reference condition	Water at 20°C
	Air at 20°C and 1.013 bar abs.
Accuracy	Based on volume flow
Liquids	$\pm 0.75\%$ of measured value ( $Re \geq 20000$ )
	$\pm 2.0\%$ of measured value ( $10000 < Re < 20000$ )
Gases and steams	$\pm 1.0\%$ of measured value ( $Re \geq 20000$ )
	$\pm 2.0\%$ of measured value ( $10000 < Re < 20000$ )
	Pressure and temperature compensation: $\pm 1.5\%$ of measured value ( $Re \geq 20000$ ); $\pm 2.5\%$ of measured value ( $10000 < Re < 20000$ )
Repeatability	$\pm 0.1\%$ of measured value
Long-term stability	$\pm 0.01\%$ of measured value

## Operating conditions

### Temperature

Product	-40...+240°C / -40...+465°F
Ambient	Non-Ex: -40...+85°C / -40...+185°F
	Ex: -40...+60°C / -40...+140°F
Storage	-50...+85°C / -58...+185°F

### Pressure

Product	Max. 100 bar / 1450 psi; Information on higher pressures on request.
Ambient	Atmosphere

### Chemical properties

Density	Taken into consideration when sizing.
Viscosity	< 10 cP
Reynold's number	10000...2300000

### Recommended flow velocities

Liquids	0.3...7 m/s / 0.98...23 ft/s (optional up to 10 m/s / 32.8 ft/s taking cavitation into account)
Gases and steams	2.0...80 m/s / 6.6...262.5 ft/s
	DN15: 3.0...45 m/s / 9.8...148 ft/s; DN25: 2.0...70 m/s / 6.6...230 ft/s
	For detailed information, see chapter "Flow tables".

### Other conditions

Protection category	IP 66/67
---------------------	----------

### Installation conditions

Inlet run	≥ 20 x DN (without disturbing flow, after pipe narrowing, after a single 90° bend)
	≥ 30 x DN (after a double bend 2x90°)
	≥ 40 x DN (after a double three-dimensional bend 2x90°)
	≥ 50 x DN (after control valves)
	≥ 2 DN before flow straightener; ≥ 8 DN after flow straightener (specified values apply only to original ≥ 20 DN inlet run)
Outlet run	≥ 5 x DN
Dimensions and weights	For detailed information refer to chapter "Dimensions and weights".

### Materials

Measuring sensor and process connections	Standard: 1.4404/316L
	Option: Hastelloy® C-22 on request
Converter housing	Die-cast Aluminium
Pressure sensor gasket	Standard: FPM
	Option: FFKM

Measuring tube gasket	Standard: 1.4435/316L
	Option: Hastelloy® C-276
	Selection depends on measuring sensor material/medium.

### Process connections Flange version

DIN EN 1092-1	DN15...300 in PN16...100
ASME B16.5	½...12" in 150...600 lb
JIS B 2220	DN15...300 in JIS 10...20 K
	For detailed information on combination flange/pressure rating, refer to chapter "Dimensions and weights".

### Process connections Sandwich version

DIN	DN15...100 in PN100 (higher pressures on request)
ASME	½...4" in 600 lb (higher pressures on request)
JIS	DN15...100 in 10...20 K (higher pressures on request)

### Electrical connections

Power supply	Non-Ex: 14...36 VDC
	Ex: 14...30 VDC

### Current output

Description of the used abbreviations	$U_{ext}$ = external voltage; $R_L$ = load + resistance
Measuring range	4...20 mA (max. 20.8 mA) + HART® protocol
Load	Minimum 0 $\Omega$ ; maximum $R_L = ((U_{ext} - 14 \text{ VDC}) / 22 \text{ mA})$
Error signal	Acc. to NAMUR NE43
	Upper value: $\geq 21.0 \text{ mA}$
	Lower value: $\leq 3.6 \text{ mA}$ (not with HART® protocol)

### Pulse output

Pulse rate	Max. 0.5 pulse/s (corresponds to 1800 pulses/hour)
Power supply	Non-Ex: 24 VDC as NAMUR or open < 1 mA, maximum 36 V, closed 100 mA, $U < 2 \text{ V}$
	Ex: 24 VDC as NAMUR or open < 1 mA, maximum 30 V, closed 100 mA, $U < 2 \text{ V}$

### HART®

	HART® protocol via current output
Device revision	1
Physical layer	FSK
Device category	Transmitter, galvanically isolated
System requirements	Load min. 250 $\Omega$
Multidrop operation	4 mA

### Approvals and certifications

ATEX	ATEX II 2G Ex d ia [ia] IIC T6
FM	Class I, II, III Div 1/2, groups A-G

## 2.2 Dimensions and weights

### 2.2.1 Flange versions

Option: version with 2 transmitters

a = 135 mm / 5.32"

b = 108 mm / 4.26"  
c = 184 mm / 7.25"

Dimension H x 2  
Specified weight + 2.80 kg

### Flange version EN 1092-1

### 3.1 Intended use

The vortex flowmeters are made to measure the flow of gases, vapours and liquids.

**The devices are particularly suitable for the measurement of:**

- Clean liquids with low viscosity (< 10 cP)
- Hydrocarbons with low viscosity (< 10 cP)
- Water
- Chemicals with low corrosiveness
- Saturated steam
- Superheated steam, including CIP and SIP applications in the food industry
- Industrial gases

**The devices are rated for the following flow velocities:**

- Liquids: 0.3...7 m/s / 1.0...23 ft/s
- Gases and steam: 2.0...80 m/s / 6.6...262 ft/s  
DN15: 3.0...45 m/s / 9.8...148 ft/s; DN25: 2.0...70 m/s / 6.6...230 ft/s

If the danger of waterhammers can occur in steam networks appropriate condensate separators have to be installed.

Suitable measures must be taken to avoid water cavitation if it is a possible risk.

*Responsibility for the use of the measurement devices with regard to suitability, intended use and corrosion resistance of the used materials against the measured fluid lies solely with the operator.*

- The sensors are made from Stainless Steel 316 L (1.4404) or Hastelloy® C22.
- In your project planning, please observe the data given in the corrosion tables.
- The pressure-bearing parts have been designed and rated for stationary operation taking into account the maximum pressure and temperature.
- Observe the data indicated on the nameplate for PS, TS and PT (PED 97/23/EC).
- External forces and moments, caused e.g. by pipe stresses, have not been taken into account.

Primarily, volumetric flow and temperature are measured, with pressure measurement as an option. From these parameters the measuring device calculates the mass flow or standard volumetric flow using pre-programmed density data and then exports the measured values via various communication interfaces.

## 3.2 Installation conditions

*For accurate volumetric flow measurement the measuring device needs a completely filled pipe and a fully developed flow profile.*

*Please observe the instructions regarding inlet and outlet pipe runs as well as the installation position.*

*In the event of vibrations on the piping, select the installation site so that the vibrations are at their lowest in a transverse direction to the flowmeter.*

***When installing the device in the piping, the following points must be observed:***

- *Nominal diameter of connection pipe flange = nominal flange diameter of pipe!*
- *Use flanges with smooth holes, e.g. welding neck flanges.*
- *Align carefully the holes of the connecting flange and the flowmeter flange.*
- *Check the compatibility of the gasket material with the process product.*
- *Make sure that the gaskets are arranged concentrically. The flange gaskets must not project into the pipe cross-section.*
- *The flanges have to be concentric.*
- *There must not be any pipe bends, valves, flaps or other internals in the immediate inlet run.*
- *Devices in sandwich version may only be installed using a centering ring.*
- *Never install the device directly behind piston compressors or rotary piston meters.*
- *Do not lay signal cables directly next to cables for the power supply.*

*If the danger of waterhammers can occur in steam networks appropriate condensate separators have to be installed.*

*Suitable measures must be taken to avoid water cavitation if it is a possible risk.*

### 3.2.1 Measurement of liquids

#### Prohibited installation

Figure 3-1: Upper pipe bend

*Prohibited: Installing the device in an upper pipe bend ①, because there is a risk of gas bubbles ② forming. Gas bubbles can lead to pressure surges and inaccurate measurement.*

Figure 3-2: Downpipe and outlet

*Prohibited: Installing the device in a downstream pipe ③ or upstream pipe of a outlet ④. There is the risk of partially filled pipes.*

### Recommended installations for measurement of liquids

*It is absolutely necessary to comply with the required inlet and outlet runs.*

- ① If the device is installed in a downpipe, a standpipe must be installed immediately after it.
- ② Installing the device in an inclined standpipe.
- ③ Installing the device in a vertical standpipe.
- ④ Installing the device in the lower pipe bend.

- ① Above a horizontal pipe
- ② On a vertical pipe

*Depending on the installation position, you may have to rotate the display and/or the connection housing.*

### 3.2.2 Measurement of vapours and gases

#### Prohibited installation

- ① Lower pipe bends
- ② Condensate

*Prohibited: Installing the device in a lower pipe bend ①, because there is a risk of condensate forming ②.*

*Condensate can lead to cavitation and inaccurate measurement. Under certain circumstances the device can be destroyed and the measured product can leak.*

#### Recommended installations

*It is absolutely necessary to maintain the required inlet and outlet runs.*

- ① Inlet and outlet falling
- ② Rising inlet - falling outlet

### 3.2.3 Heat insulation

*The area above the converter support must not be heat-insulated.  
The heat insulation ③ may only extend to the maximum height ① shown below up to the connecting screws of the measuring sensor.*

Figure 3-3: Heat insulation on connection piece and signal cable

- ① Max. height of insulation up to intermediate piece between measuring sensor and signal converter
- ② Max. thickness of the insulation up to the bend of the pressure pipe
- ③ Insulation

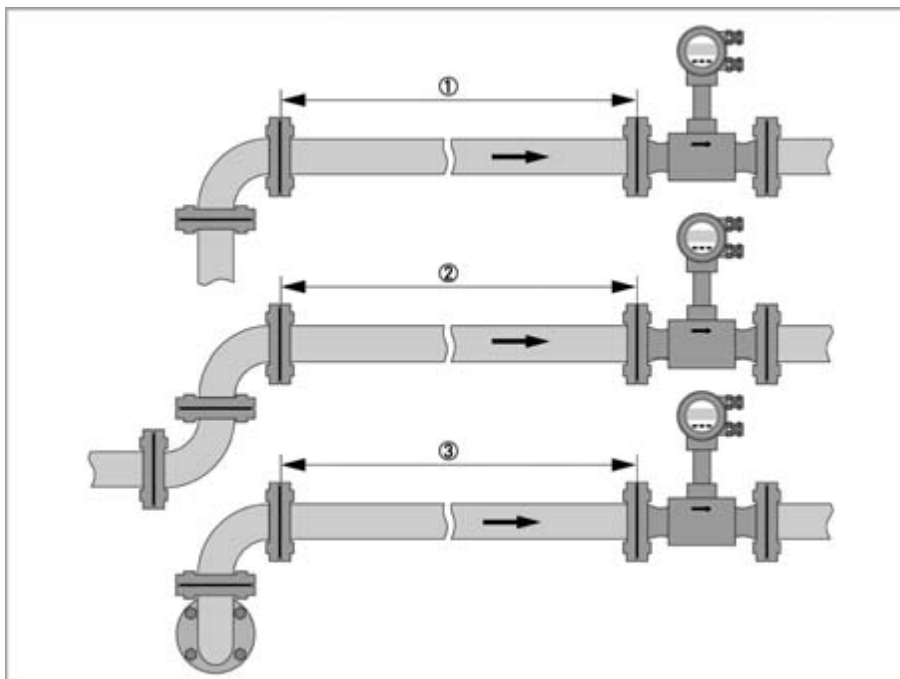

*The heat insulation ③ may only extend as far as the bend of the pressure sensing line ②.*

### 3.3 Inlet and outlet runs

#### 3.3.1 Minimum inlet runs

- ① General inlet run without disturbing flow  $\geq 20$  DN
- ② Behind a control valve  $\geq 50$  DN
- ③ After a pipe diameter reduction  $\geq 20$  DN

- ① After a single bend  $90^\circ \geq 20$  DN
- ② After a double bend  $2 \times 90^\circ \geq 30$  DN
- ③ After a double three-dimensional bend  $2 \times 90^\circ \geq 40$  DN

### 3.3.2 Minimum outlet runs

Figure 3-4: Minimum outlet runs

- ① Upstream of pipe expanders, pipe bends, control valves, etc.  $\geq 5$  DN
- ② Upstream of metering points  $\geq 5 \dots 6$  DN

*The interior of the pipe at the metering points must be free of burrs and other flow impediments. The measuring device has an internal temperature sensor. External temperature sensor must be located  $\geq 5$  DN behind the flow sensor outlet. Use sensors that are as short as possible to avoid disturbing the flow profile.*

### 3.3.3 Flow straightener

If, due to the type of installation, the required inlet runs are not available, the manufacturer recommends using flow straighteners. Flow straighteners are installed between two flanges upstream of the device and shorten the required inlet run.

Figure 3-5: Flow straightener

- ① Straight inlet run upstream of straightener  $\geq 2$  DN
- ② Flow straightener
- ③ Straight pipe run between flow straightener and device  $\geq 8$  DN
- ④ Minimum straight outlet run  $\geq 5$  DN

## 4.1 Connecting the signal converter

Figure 4-1: Signal converter housing with housing cover

- ① Housing cover of the electrical terminal compartment
- ② Electrical connection terminals with the housing cover open
- ③ Terminal A current output -
- ④ Terminal A+ current output +
- ⑤ Terminal B pulse output -
- ⑥ Terminal B+ Pulse output +
- ⑦ PE terminal in housing
- ⑧ PE terminal on connection piece between measuring sensor and signal converter.

Both grounding terminals ⑦ and ⑧ are equally effective from a technical point of view.

## 4.2 Electrical connection of current and pulse output

- **Current output:**  
In some cases, a shielded or twisted cable may be necessary. The cable shield may only be earthed (grounded) at one place (on the power supply unit).
- **Pulse output:**  
When using the pulse output, two separate signal circuits are necessary if the pulse output is utilized together with analogue signals. Each signal circuit requires its own power supply. The total resistance must be adapted so that the total current  $I_{tot}$  does not exceed 100 mA.
- Connection current output on terminals A, A+  
Connection pulse output on terminals B, B+

Figure 4-2: Electrical connection of current and pulse output

- ① Power supply per signal circuit
- ② Optional display unit
- ③ Load for HART®  $\geq 250 \Omega$
- ④ e.g. counter

The maximum load resistance is calculated as follows:

$$R_L = \frac{U_{ext.} - 14V}{22 mA}$$

### 4.3 Remote version connection

The connections in the sensor and wall mount bracket connection boxes are identical in construction.

#### Connection cable strand colour

	Connection	Terminal no.:	Strand colour
①	Pressure sensor	5	brown
		4	rose / pink
		3	green
		2	grey
		1	white
②	Temperature sensor	2	black
		1	purple
③	Vortex Sensor	3	red
		2	yellow
		1	blue

#### Remote connection cable

- ① Sensor connection side - strand length approx. 100mm
- ② Length of shrink hose approx. 30mm
- ③ Wall housing connection side - prefabricated shielding - length approx. 15mm

Please provide us with the missing information so that we can be of help to you as quickly as possible.

Then please fax this page to the appropriate sales associate. We will then contact you as soon as possible.
